

(英語)

一酸化炭素中毒に注意 (家庭)

Be careful of carbon monoxide poisoning.

Kerosine stoves burn using the air in the room, so if the room is not properly ventilated, the level of oxygen decreases and this may lead to carbon monoxide (CO) poisoning due to incomplete combustion. This is especially likely when using kerosene stoves after a long time, as the kerosene has become old and the possibility of incomplete combustion increases.

Please be sure that your room has enough air ventilation by opening the windows, even it's cold etc.
