

(英語)

一酸化炭素中毒に注意(避難所)

Be careful of carbon monoxide poisoning (evacuation shelters)

Electrical generators are used to make electricity at the shelters in affected area where the electricity does not go on, or in such areas as the Kanto region where planned blackouts are put into practice. In some cases, the generators are placed outside; it is possible that carbon monoxide poisoning will occur if the generator is set at the entrance of the shelter and the direction of the wind changes, etc. If anyone gets a headache or starts to feel sick near the generator, they may be suffering from carbon monoxide poisoning. In that case, please ask the medical staff to change the position of the generator or to let some fresh air into the room
